

Revenio Next.js Assessment Task

Build a simple application using **Next.js (App Router)**. The app should have **public and protected pages** with authentication using **Firebase**. You can choose any idea to implement the task, e.g., **event management, course management, e-commerce, blogs, etc.**, or any of your custom ideas.

Focus on **polished UI, responsiveness, and layout consistency**. Functionality can be minimal but must include the protected page and login.

1. Landing Page (/)

Must include 7 sections:

1. **Navbar** - logo, 4+ routes, login/register, sticky, responsive
 - After login, show a dropdown with:
 - Logged-in user info (replacing login/register)
 - Add Product
 - Manage Products
2. **Hero** - headline, subtitle, primary CTA, optional background
3. **4 Relevant Sections** - choose based on theme (e.g., features, items, testimonials, banner)
 - Cards/layout must be uniform with hover/focus states
 - Clear hierarchy, spacing, and responsive design
4. **Footer** - links, optional social icons, copyright, consistent spacing

2. Items Page (/items)

- Search bar
- Filtering must be implemented using **at least 2 fields** (e.g., category, price, rating, date, location).
- Display a **minimum of 6 items (static data / local storage)**
- Grid layout (responsive)

Each card must include:

- Image or icon
- Title
- Short description (1-2 lines)
- Button → “View Details”

3. Item Details Page (/items/[id])

- Dynamic route using App Router
- Show:
 - Title
 - Image
 - Full description
 - Key information / Specifications
 - Related items (*if applicable*).
 - Additional info (price/date/category)
- Back button to Items page

4. About Page (/about)

- Simple page about your app
- Add:
 - Title
 - Description
 - Optional image or section

5. Authentication (Firebase)

Implement **Firebase Authentication**:

- Email & Password login/register
- Google login (optional but recommended)
- Store user state (using Context API or simple state)
- Redirect to [/](#) after login

6. Protected Page: Add Items (/items/add)

- Only accessible when logged in; redirect others to [/login](#)
- Form fields:
 - Title
 - Short description
 - Full description
 - Price/date/priority/relevant field
 - Optional image URL
- Buttons: **Submit** (add)
- On success: show toast or confirmation message

7. Protected Page: Manage Items (/items/manage)

- List all products in a table/grid
- Each row/card with actions: View, Delete
- The layout should be clean, readable, and responsive

Overall UI Guidelines

1. **Layout & Responsiveness** - consistent spacing, clean layouts, adaptive for mobile/tablet/desktop.
2. **Typography & Colors** - clear hierarchy, readable fonts, consistent color palette.
3. **Cards, Lists & Forms** - uniform cards with hover/focus, responsive grids, clean forms with inline validation and optional loading states.
4. **Interactions & Consistency** - Hover/focus for interactive elements, visual consistency across pages, optional micro-animations.

Technologies

- Next.js (App Router) for the frontend application
- Firebase for authentication ([Read Documentation](#))

Submission Requirements

- GitHub Repository link
- Live demo (Vercel recommended)
- **README.md** including:
 - Short project description
 - Project key features
 - Setup & installation instructions
 - Route summary
